

## **AMK3100-G/P Series Inverter**

---

### **USER'S MANUAL**

**SHENZHEN ZHENYEYUAN INDUSTRIAL AUTOMATION  
EQUIPMENT CO.LTD**

## 2. Installation and Wiring

### 2.1 Specification

Items		standard	
Input	Rated voltage and frequency	Three Phase 380V, 50/60Hz	
	Voltage allowable vibration range	320V~460V	
Output	Voltage	0~380V	
	Frequency	0Hz ~ 500Hz	
	Over-load capability	G3 Series: 150% rated current for 1 minute, 180% rated current for 2 seconds; P3 Series: 120% rated current for 1 minute, 150% rated current for 2 seconds.	
	Control mode	V/F Control	
Control character	Freq. Setting resolution	Analog terminal input	0.1% max output frequency
		Digital setting	0.01Hz
		Panel analog setting	0.4 % max frequency
		External pulse	0.1% max frequency
	Freq. accuracy	Analog Input	Within 0.2% max. output frequency
		Digital Input	Within 0.01% Setting output frequency
		External pulse	Within 0.1% Max. output frequency
	V/F Curve (Voltage-Frequency character)		Base frequency can be set from 5~500Hz arbitrarily, and there are three kinds of curve: constant torque, Dec torque 1 and Dec torque 2.
	Torque Boost		Manual Setting: 0~20% of rated output, Auto-boost: Automatically boost torque according to output current.
	Auto Energy-saving running		Adjust output voltage and slip compensation properly according to output current, which will make the motor working in highest efficiency.
	Acc./Dec time setting		0.1~6000 seconds can be set continuously, and S type and line type can be selected
	Braking	Dynamic braking	Over 75% (External the braking resistor)
		DC braking	It is selected respectively at start and stop, and its frequency is 0~15Hz, the action voltage is 0~15%, and the action time is 0~20.0 second or act continuously
	Auto current-limiting function		Fast auto current-limiting function ensures not to occur the over-current during the accelerate process or under the impact load.
	Voltage stall prevention		Ensure not over-voltage in Dec process.
	Low noise running		Carrier freq. can be adjusted continuously form 1.5KHz to 15.0KHz, which can reduce the motor's noise furthest.

	Speed tracking restart		It can realize the smoothness restart and instantaneous stop then restart function.
Freq setting signal	Analog input	DC voltage 0~10V、-10V~10V, DC current 0~20mA ( Upper limit and Lower limit can be selected )	
	Digital setting	By the operation panel	
	Pulse input	0~10kHz (Upper limit and Lower limit can be selected)	
	Startup signal		FWD, REV, Startup signal can be selected and self-keep (Three line control)
	Timer and Counter		Embedded one timer and one counter,which will help the system's integration
	Multi-speed control function / Wobble frequency		Seven stages programmable multi-speed control at most, every stage's running direction, running time can be set respectively. In external terminal control, It reaches 15 stages, and there are 6 kind of running modes.Including wobble frequency
Embedded PID control	Ordinal PID	Expediently compose the simple control system without accessional PID controller.	
	Special for water supply (Need accessories)	Be able to construct the constant-pressure water-supply system of 4 pumps switch at most, which includes the following functions:pressure upper or Lower limit alarm,Sleep or wake, Timing water-supply etc. multi kind running mode.	
	Operation function		Setting the upper and lower limit of frequency, frequency jump-running, reversal running limit, slip frequency compensation, auto constant-voltage running, RS485 communication frequency increment and decrement control, fault self-restore running, multi inverter coupled running
Output signal	Running status (OC Output)	During the running of inverter, Frequency arrival, Frequency level detection, over-load alarm, and external fault stop-machine. Frequency upper-limit arrival, Frequency lower-limit arrival, under-voltage stop,zero-speed running, programmable multi-speed running state, Internal counter arrival, Internal timer arrival,Pressure lower-upper limit alarm	
	Indicated instrument	Output Freq., Output current, Output voltage, Motor speed, PID setting and feedback, External voltmeter, External cymometer.	

Display	Operation panel display	Running status	Output Freq., Output current, Output voltage, Motor rotate speed, Setting Freq., PID setting, PID feedback, Model temperature, Accumulative running time, Analog I/O, Terminal Input status
		Alarm content	Last six fault records, Output frequency, Setting frequency, Output current, Output voltage, DC voltage, Model Temperature, Terminal status, Accumulative running time of Last fault trip.
Protective / Alarm function			Over-current, over-voltage, under voltage, electronic thermal protection, over-heat, short-circuit.
Operating Environment	Temperature	-10°C to +50°C	
	Humidity	Under 90% (non-condensing)	
	Ambient environment	Indoors (no inflammable gasses or dust)	
	Altitude	Under 1000m	
Structure	Protective class	IP20	
	Cooling method	Fans cooling	
Mounting model		Wall mounting	

## 2.2 Installation size of inverter

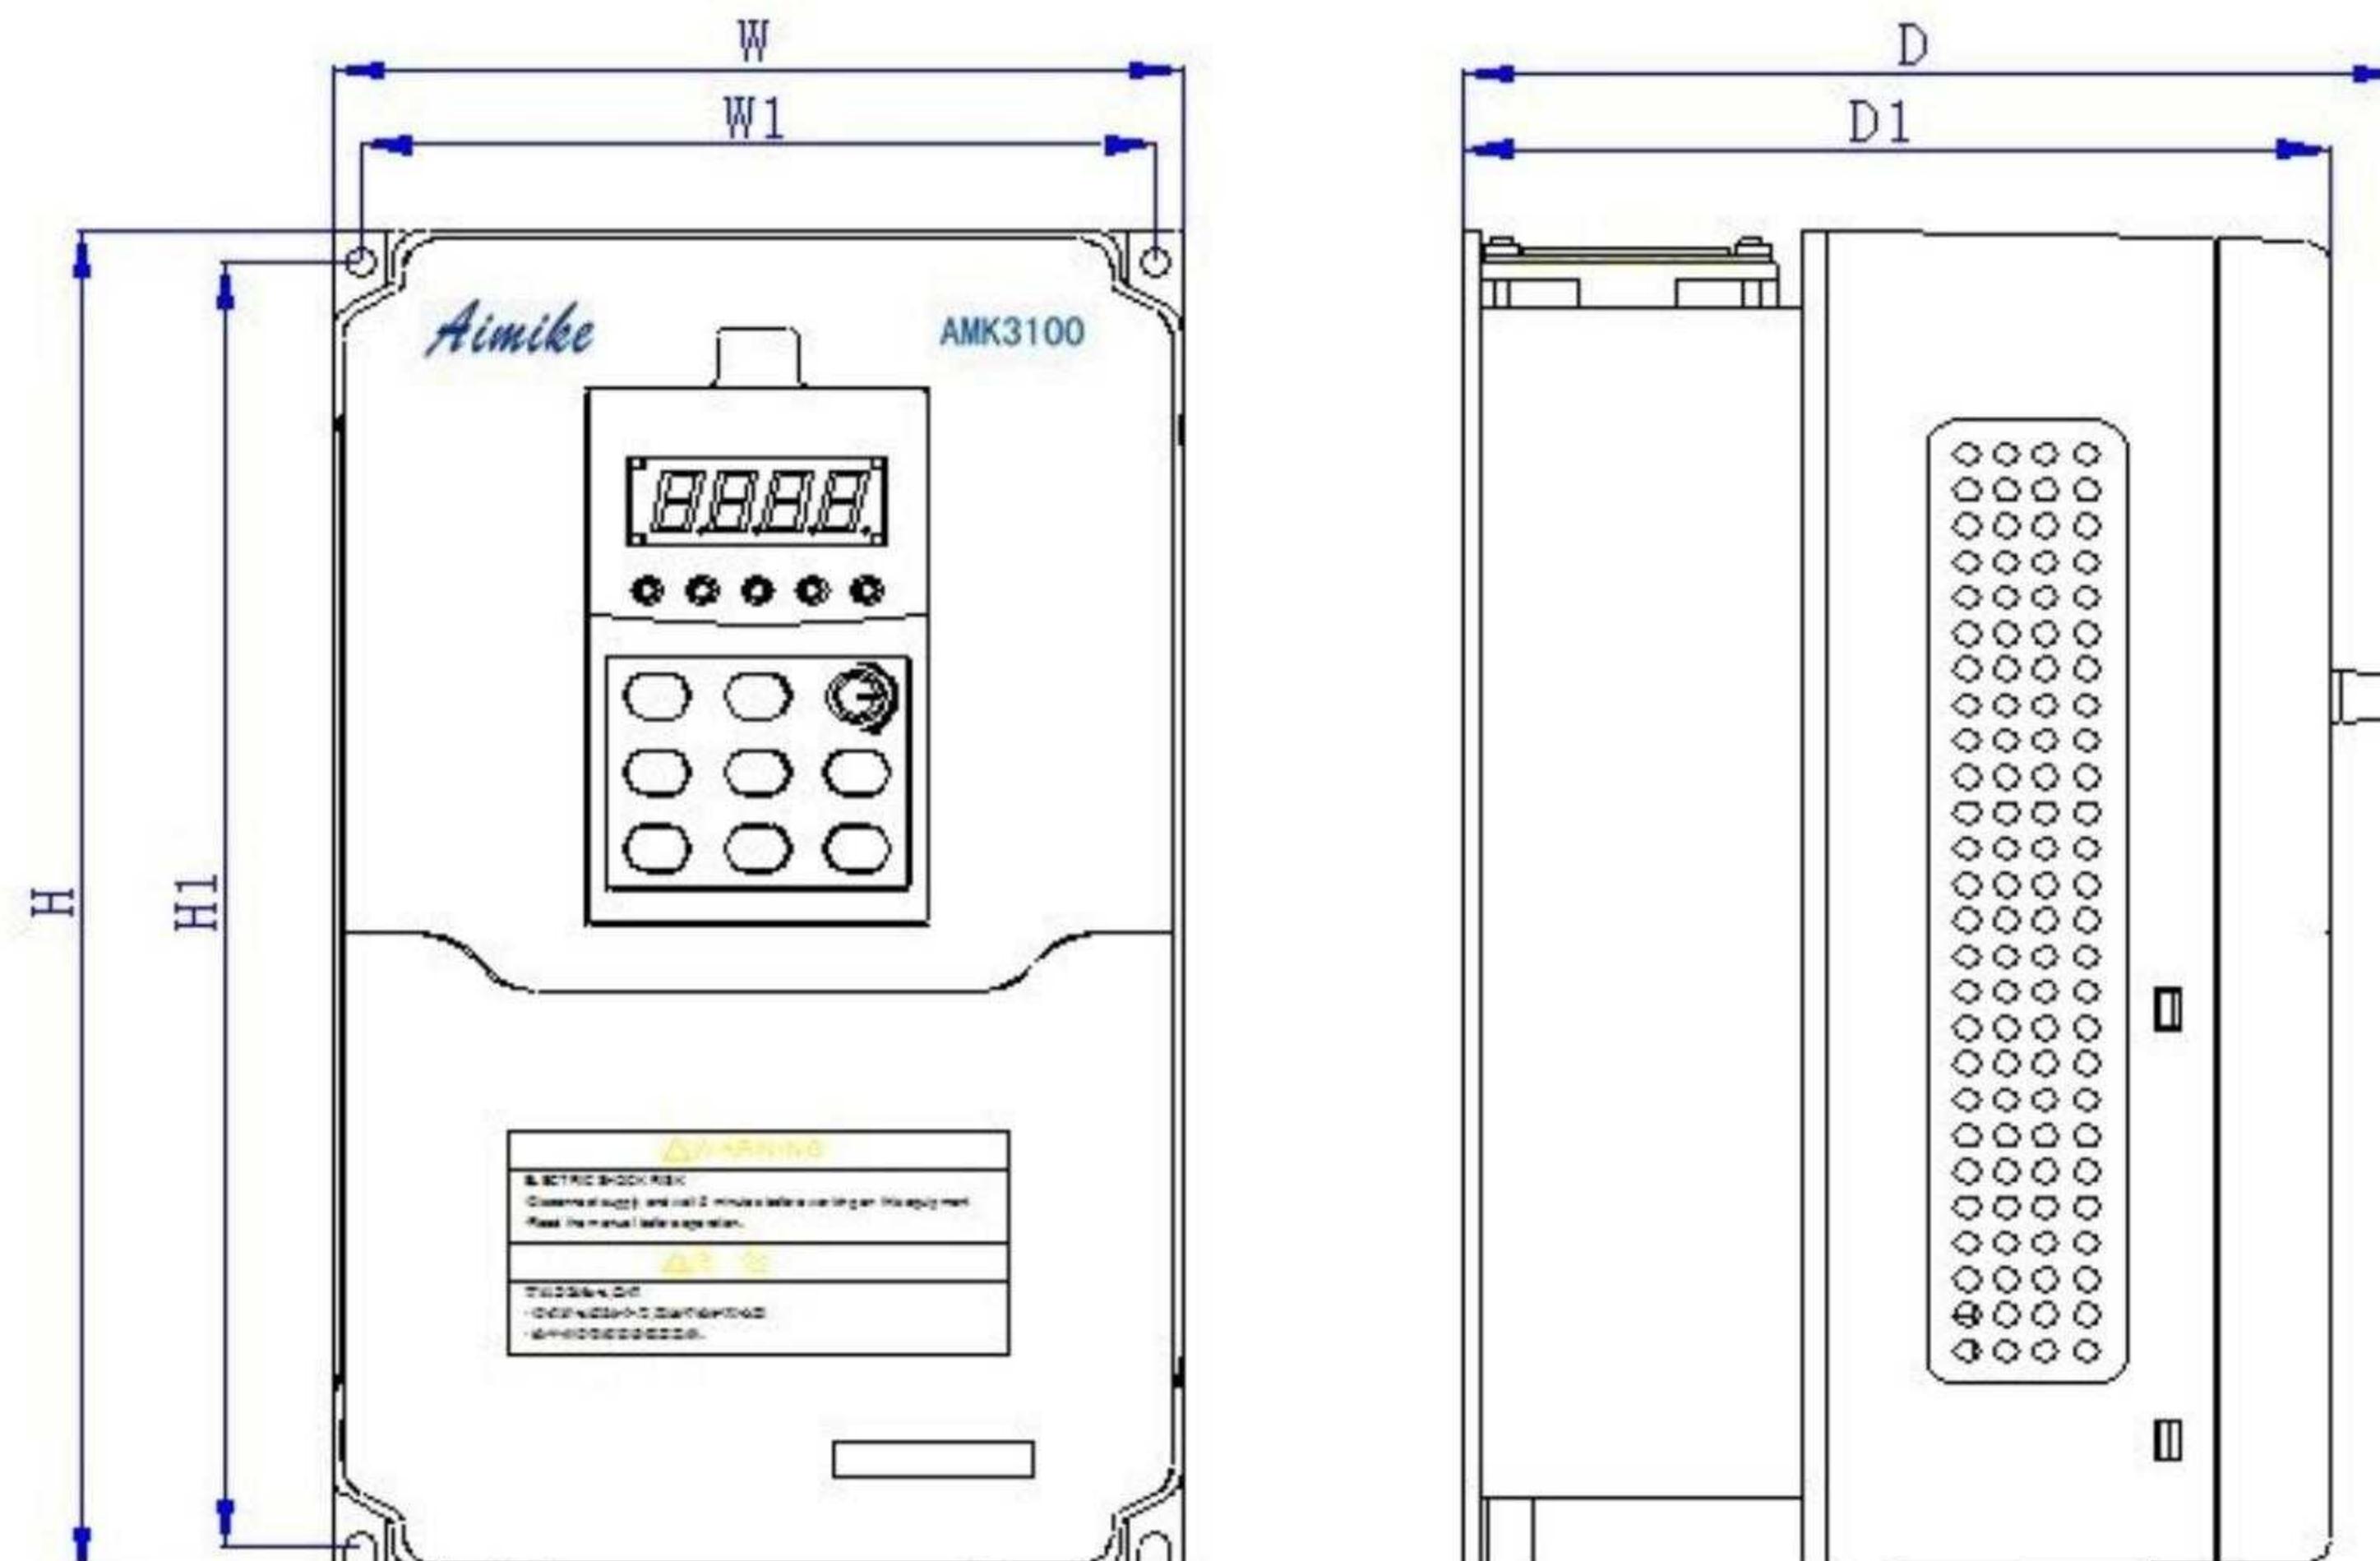

Fig. 2-1 Installation size of inverter

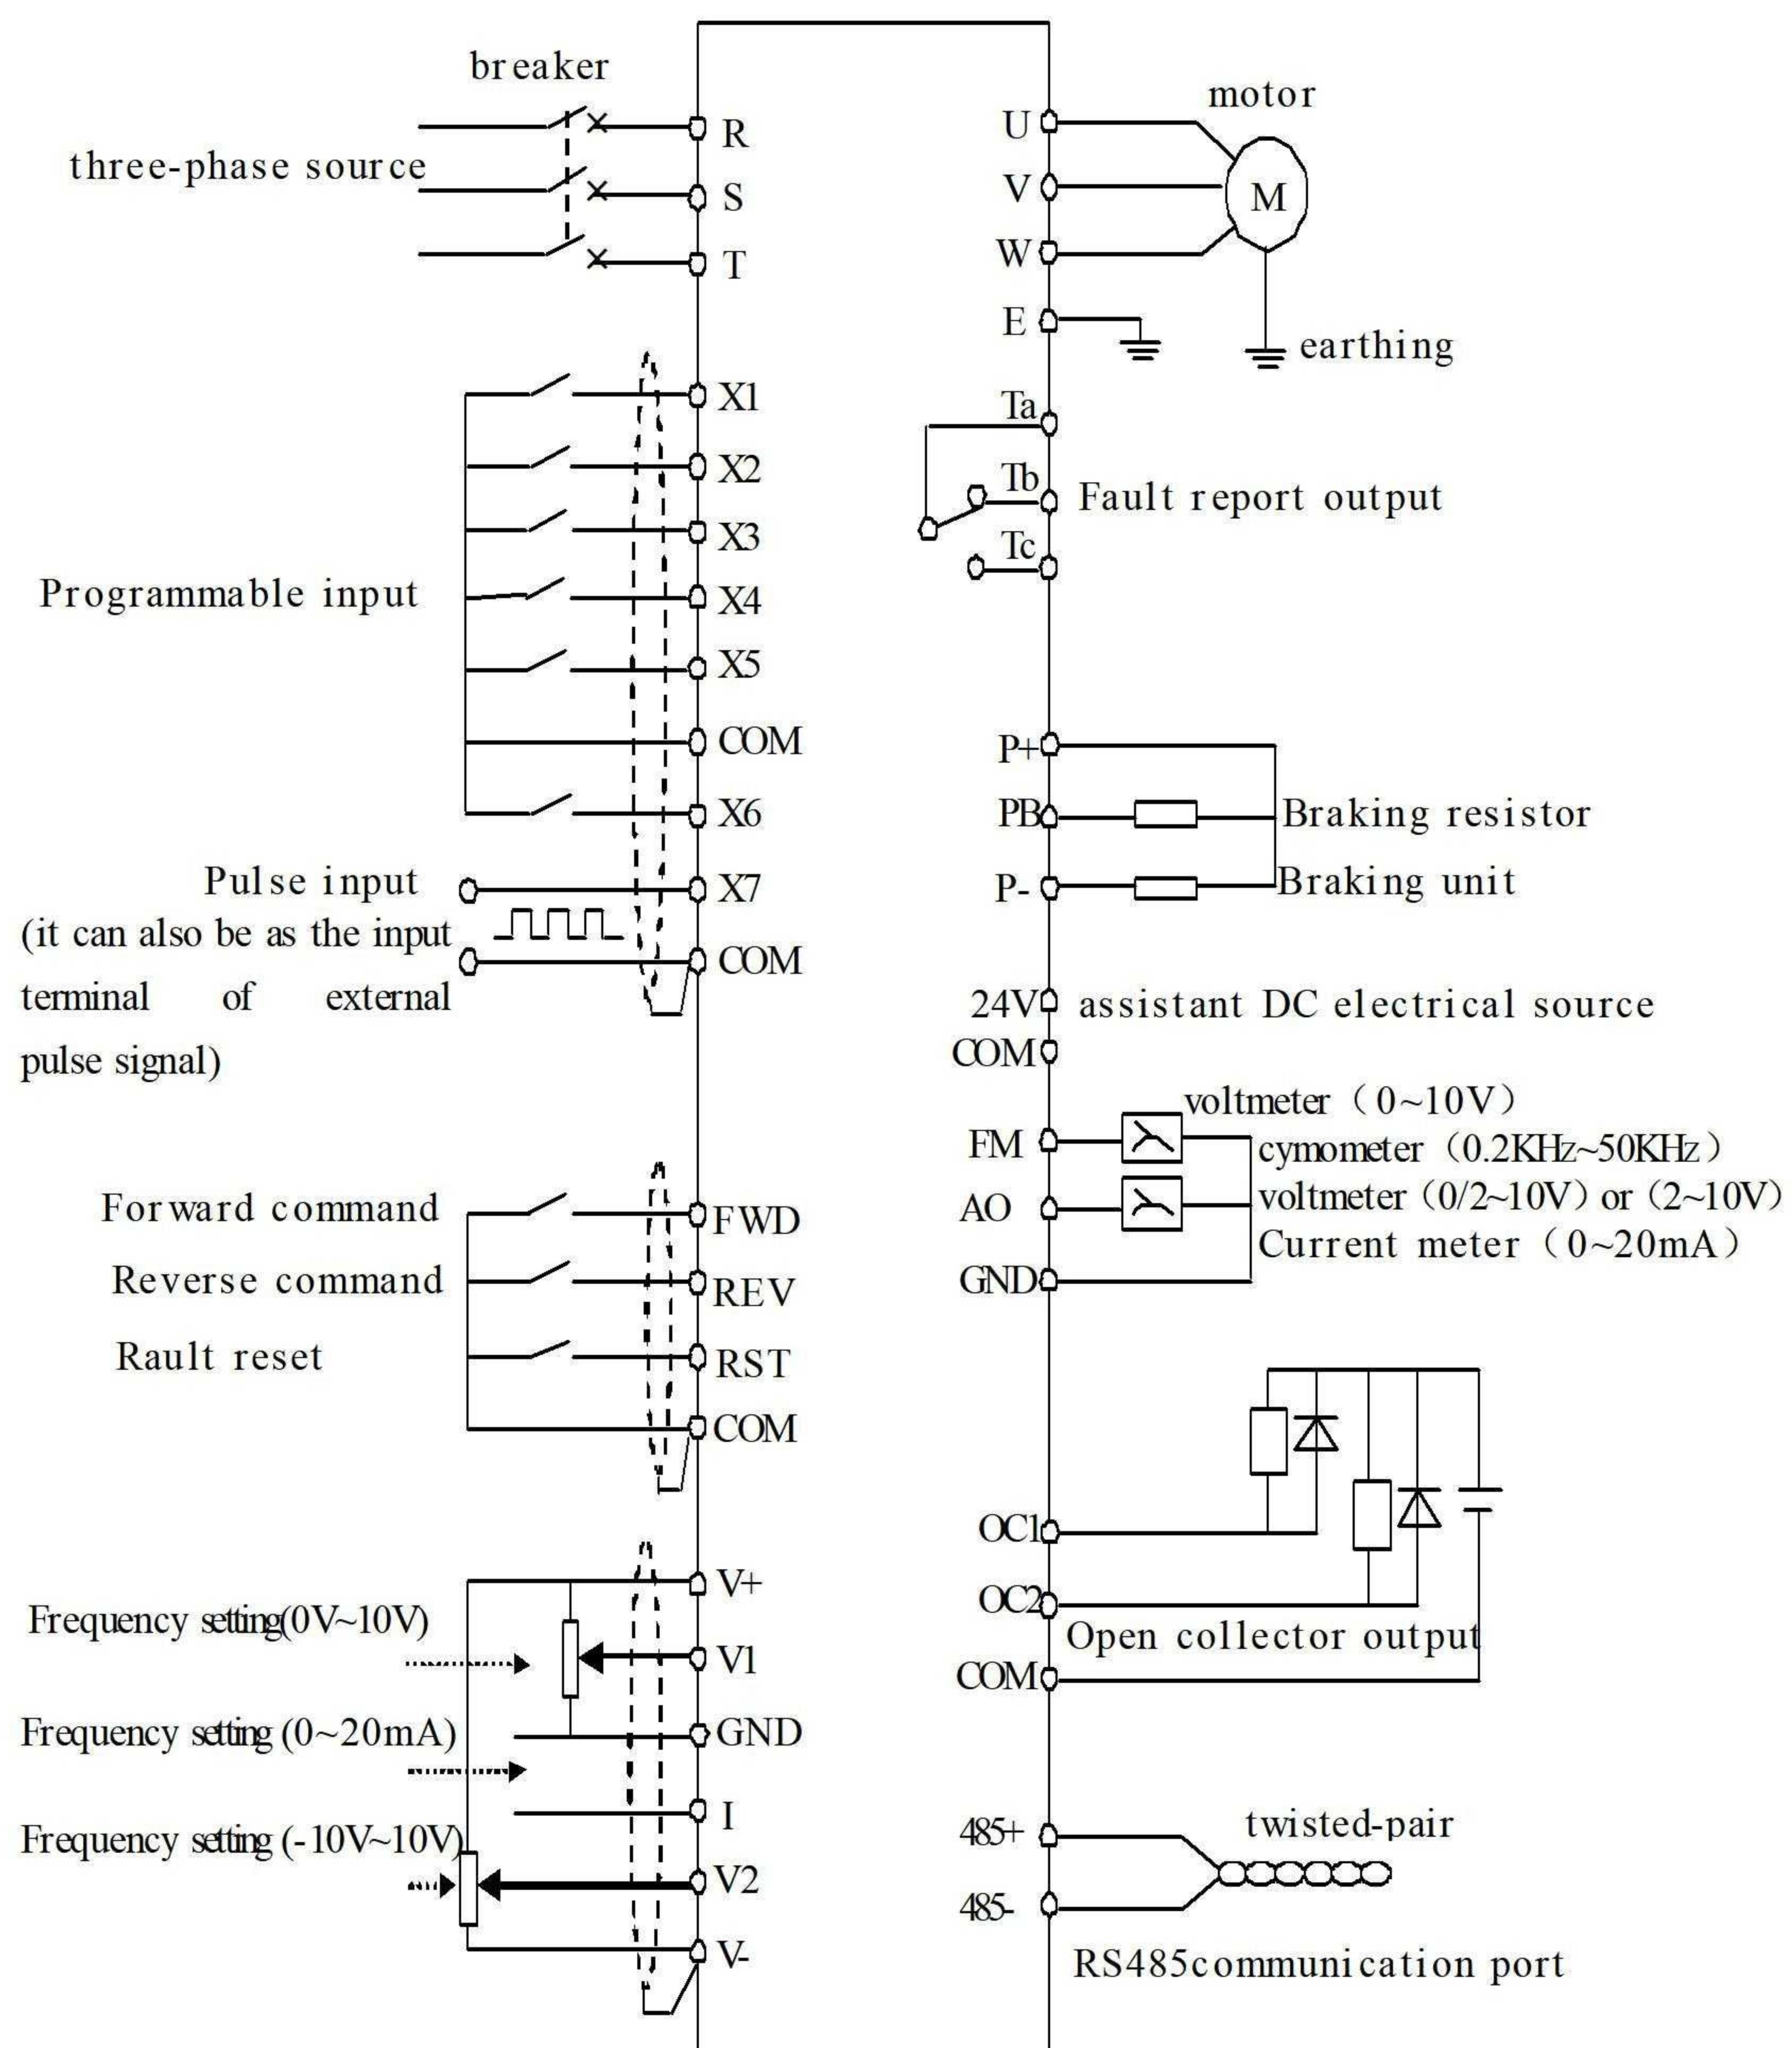

Wall-mounting inverter:

Inverter model		W1 (mm)	W (mm)	H1 (mm)	H (mm)	D1 (mm)	D (mm)	screw standard
G3 Series	G3 Series							
AMK3100-G3	AMK3100-P3

## 2.3 Basic Running Wiring Diagram

Form 2-2 Basic Running Wiring Diagram

## 2.4 Terminals of control circuit

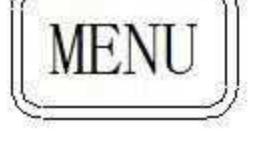

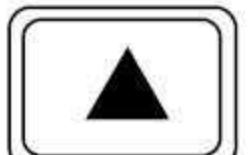

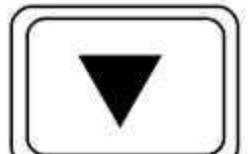

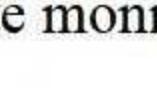

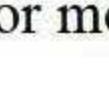

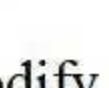

### 2.4.1 Terminals of Control circuit

#### 2.4.2 Description of terminals of control circuit

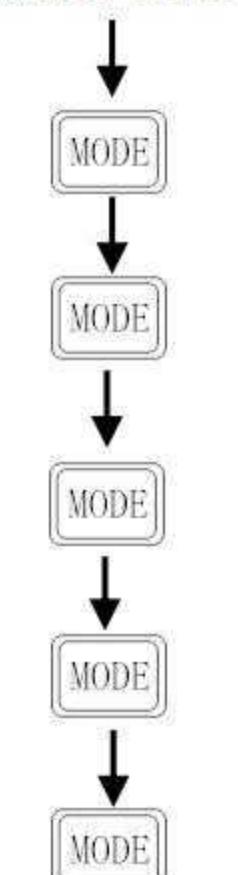

Type	Terminal	Terminal function	Notes
Analog input	+10V/V+	Provide +5V/50mA power or +10V/10mA power to external	Selected by control panel JP1 (refer to the following diagram)
	V-	Provide -10V/10mA power	
	V/V1	Frequency setting voltage signal input terminal 1	0 ~ 10V
	V2	Frequency setting voltage signal input terminal 2	-10 ~ 10V
	I	Input positive terminal of frequency setting current signal (Current input terminal)	0 ~ 20mA
	GND	Command terminal of Frequency setting voltage signal (Power earth of V+、V-), Negative terminal of frequency setting current signal ( Current output terminal )	
Control Terminal	X1	Multi-function input terminal 1	The detailed function of Multi-function input terminal is set by parameter b-63~b-69, the terminal is valid while being closed with CM termina
	X2	Multi-function input terminal 2	
	X3	Multi-function input terminal 3	
	X4	Multi-function input terminal 4	
	X5	Multi-function input terminal 5	
	X6	Multi-function input terminal 6	
	PUL/X7	Multi-function input terminal 7, and it can also be as the input terminal of external pulse signal (refer to the following diagram)	
	FWD	FWD control command terminal	The terminal is valid while being closed with COM terminal. The on-off of terminals FWD and CM decides the running direction in panel control mode.
	REV	REV control command terminal	
	RST	Fault resetting input terminal	
	COM	Command terminal of control terminal	
Analog output	+24V	Provide +24V/50mA Power (COM is the ground of power)	
	A0	Programmable voltage signal output terminal can connect the external voltmeter (set by parameter A-10).	Highest allowable Current: 1mA; Output voltage:0-10V
OC output	FM	Programmable frequency signal output terminal can connect the external cymometer. (Set by parameter A-11)	Max. output signal frequency: 50KHz Signal amplitude value: 10V
	OC1 OC2	Programmable open-circuit collector output is set by parameter A-15 and A-16.	The highest loadcurrent is 50m and The highest withstand voltage is 24V
Fault output	TA	Normal: TA-TB is closed	Contact capacity: AC250V 1A resistive load
	TB	TA-TC is off	
	TC	Fault: TA-TB is off TA-TC is closed	
RS485 communication	485+ 485-	RS485 Communication terminal	
E	ERH	Earth terminal	

### 3.1 Panel function description

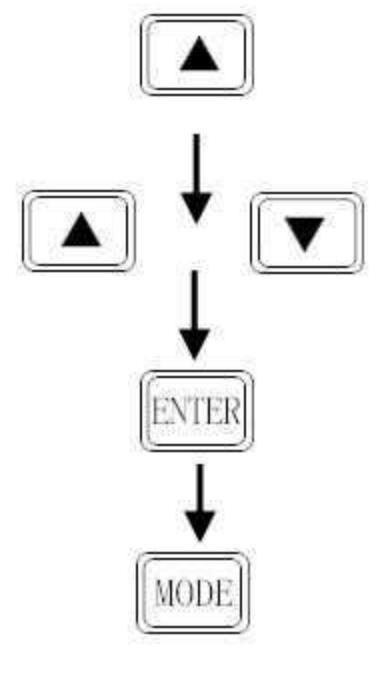

Items		Function description
Display function	Code display	Display the running parameter and setting parameter of inverter
	A、Hz、V	The corresponding unit of current number display
	MOD	In no-monitor state, the indicator light will be on. If there is no key-press in one minute, the indicator will be off and return the monitor state.
	ALM	Alarm indicated light. It expresses that the inverter is in over-current or over-voltage restrain state
	FWD	FWD indicated light. It expresses that inverter will output the positive phase. If connecting with the motor, the motor will run in positive direction.
	REV	REV indicated light. It expresses the inverter will output the negative phase sequence. If connecting with motor, the motor will run in reverse direction. If the indicated light of FWD and REV are lighted at the same time, it expresses that the inverter is in working DC brake state
Keyboard function		<b>FWD running key.</b> The running instruction of inverter channel can be set as panel control mode ( [A-3] =0 ), press this key, send out the positive running instruction. The inverter will run to the setting frequency according to the appointed acc or dec curve.
		<b>REV and JOG key.</b> The detailed function of this key is selected by parameter [A-17]. When parameter [A-17] equals 0, this key will take effect as reverse startup. When parameter [A-17] equals 1, the key is used as Jog control.
		<b>Stop and Fault reset key.</b> The inverter is in normal running mode. if the running instruction channel is set as panel stop valid mode, ( [A-3] =0、2、4 ) 时, Press this key, the inverter will stop as the fixed mode. In fault state, press the key, will reset the inverter and return the normal stop state.
		<b>Mode switch mode.</b> It is used for changing the working mode of operation panel.
		<b>Confirming key.</b> It is used for confirming the current state or parameter (Parameters are stored into the internal memory). In monitor state, press the key, will enter the modification surface directly, At the same time, MOD indicator light will be on, at that time you can modify the instruction frequency by  
	 	<b>Data modification key.</b> It is used to modify the function code and parameter. Synchronously press   key, will quicken the modification speed of parameter. First press  key, then press  key will quicken the speed of modifying data. Soften  key will keep the current speed. If first press  then press  key will quicken the speed of modification data decreasing, soften  key will keep the current speed. In state monitor mode, if the frequency instruction channel is panel digital setting mode ([A-1]=1) , press   key will modify the frequency instruction synchronously MOD indicated light will be on.
		<b>Data bits switch key.</b> In any state of press key to modify the state of data, press the key   modify the digital bit, the modification bit will be displayed blink.

### 3.2 Operation way of keyboard

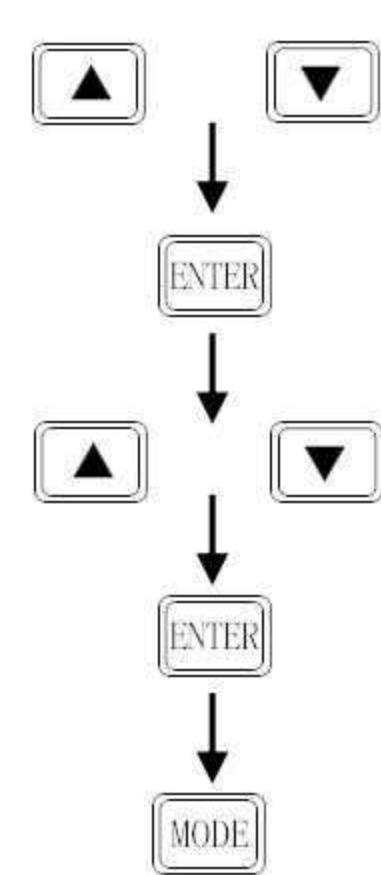

### 3.2.1 Switching mode

Operation	Description	Display
Change the working mode of operation panel	Current state of operation panel: State monitor mode	Display the current running parameter of inverter, for example: 50.00
	Enter Monitor parameter inquiry mode	Display monitor code, for example: d-0
	Enter Basic running parameter setting mode	Display code: A-0
	Enter Intermediate running parameter setting mode	Display code: b-0
	Enter Advanced running parameter setting mode	Display code: C-0
	Enter State monitor mode	

### 3.2.2 Monitor parameter inquiry

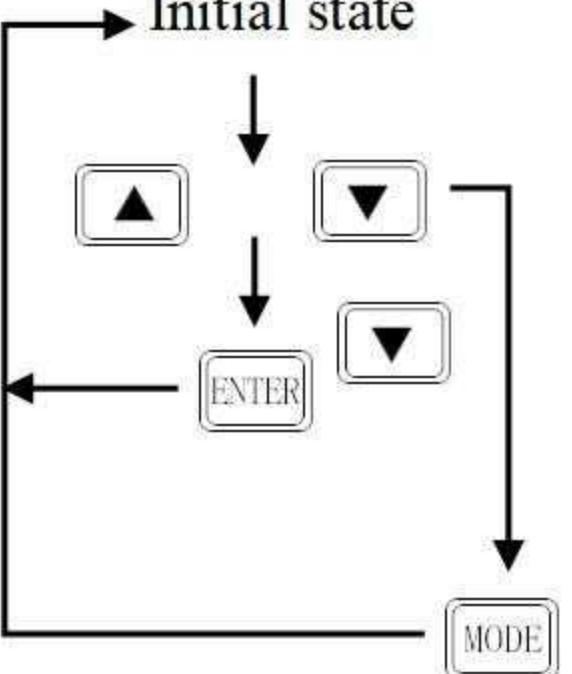

Operation	Description	Display
For example: looking over the setting frequency	Current state of operation panel monitor parameter inquiry mode	d-0 (Example)
	Monitor code plus 1	d-1
	Modify monitor code to the parameter d-4 which needs inquiry	d-4
	Confirm the inquiry monitor item	Display the Parameter value according to d-4 to set the frequency
	Switch the working mode of operation panel according to needs	

### 3.2.3 Setting parameter

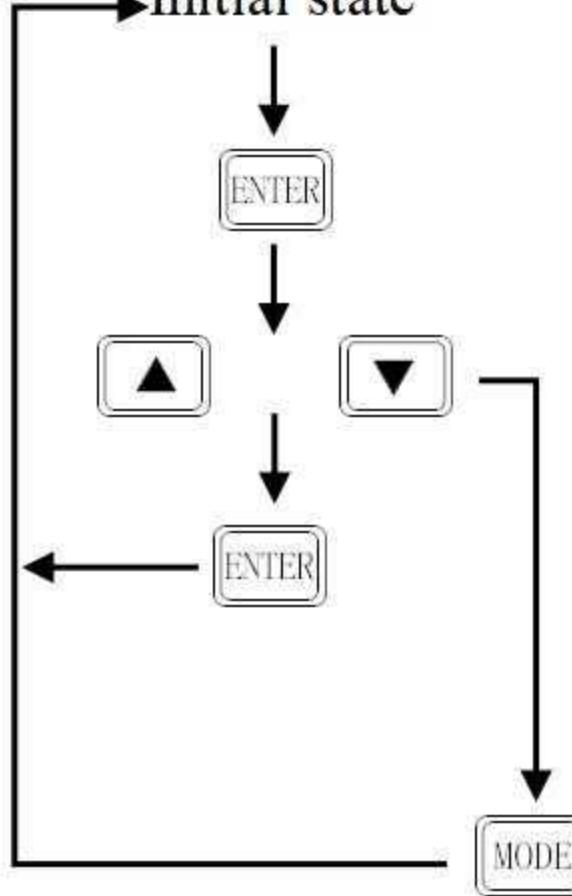

Operation	Description	Display
Change Acc time 1 from 5.0 Sec to 10.0 Sec (For example)	Current state of operation panel: parameter setting mode (Basic parameter for example)	A-0
	Modify the code of parameter to the expected value: A-7	For example: A-7 (Acc time 1)
	Confirm the parameter item being modified	Display the parameter value of A-7: 5.0
	Modify the parameter to the expected value: 10.0	10.0
	Confirm the parameter value, and store them into the internal store memory.	A-7
	Switch the working mode of operation panel according to needs	

### 3.2.4 Modification of Digital setting frequency

**Mode 1:**

Operation	Description	Display
Change the current digital setting frequency	Current state of operation panel: state monitor mode	Running parameter (Decided by parameter b-71)
	Change digital setting frequency to the expected value	Digital setting frequency
	Store the digital setting frequency into the internal, and return the state monitor mode.	Running parameter (Decided by parameter b-71)
	The digital setting frequency after modification is not stored into the internal memory, the inverter will return the state monitor mode after power-off.	

### Mode 2:

Operation	Description	Display
Change the current digital setting frequency	Current state of operation panel: state monitor mode	Running parameter (Decided by parameter b-71)
	Enter digital frequency modification mod	Digital setting frequency
	Modify the digital setting value to the expected value	Digital setting frequency
	If digital setting frequency after modification are not stored into internal memory, after power-off, the inverter will return State monitor code	Running parameter (Decided by parameter b-71)

### Note:

1. Enter the frequency setting mode in mode 1, if there is no key-press in three seconds, the inverter will return State monitor mode.
2. Enter frequency setting mode in mode 2, if there is no key-press in ten seconds, the inverter will return State monitor mode

C-79	Data format	0: No parity check 1: Even parity check 2: Odd parity check	1	0	×	ABH
C-80	Baud rate	0: 1200 bps 1: 2400 bps 2: 4800 bps 3: 9600 bps 4: 19200 bps	1	3	×	ACH
C-81	Host setting	0: The inverter is slave 1: The inverter is host	1	0	×	ADH
C-82	Coupled setting ratio	0.10~10.00	0.01	1.00		AEH
C-83	RS485 communication wire-break action mode	0: Stop 1: Keep the existing state	1	0		AFH
C-84	Reserved	----	----	----		B0H

#### 4.4 State monitor parameter table

Monitor code	Content	Unit	Address of code
d-0	Current output freq of inverter	0.01Hz	D8H
d-1	Current output curr of inverter	0.1A	DCH
d-2	Current output volt of inverter	1V	DDH
d-3	Motor's Current speed	1Rpm	DEH
d-4	Current setting freq of inverter	0.01Hz	DFH
d-5	DC bus voltage	1V	E0H
d-6	PID setting value	0.1%Mpa*	E1H
d-7	PID feedback value	0.1%Mpa*	E2H
d-8	Running linear speed	0.01*	E3H
d-9	Setting linear speed	0.01*	E4H
d-10	Input AC voltage	1V	E5H
d-11	Temperature of module	0.1°C	E6H
d-12	Total running time	1H	E7H
d-13	Input terminal state		E8H
d-14	Analog input voltage V1	0.1V	E9H
d-15	Analog input voltage V2	0.1V	EAH
d-16	Analog input current I	0.1mA	EBH
d-17	External pulse input	0.01KHz	ECH
d-18	Analog output AO	0.01V	EDH
d-19	Frequency output FM	0.01Hz*	EEH
d-20	First fault record		EFH
d-21	Second fault record		F0H
d-22	Third fault record		F1H
Monitor code	Content	Unit	Address of code
d-23	Fourth fault record		F2H
d-24	Fifth fault record		F3H
d-25	Sixth fault record		F4H

d-26	Output freq of last fault	0.01Hz	F5H
d-27	Setting freq of last fault	0.01Hz	F6H
d-28	Output current of last fault	0.1A	F7H
d-29	Output voltage of last fault	1V	F8H
d-30	DC voltage of last fault	1V	F9H
d-31	Temperature of module of last fault	0.1°C	FAH
d-32	Input terminal state of last fault		FBH
d-33	Accumulated running time of last fault	1H	FCH

**HINT:** Code Address is the appointed address while visiting these monitor parameters by RS485 interface.

### Protection and solution

Code	Probable Cause	Fault description	Solution
Er. 01	Over-current during Acc	1. Acceleration time is too short 2. Torque boost is too high or V/F curve is not suitable.	1. Extend the acceleration time 2. Descend the torque boost or adjust the V/F curve.
Er. 02	Over-current during Dec	Deceleration time is too short	Increase the deceleration time.
Er. 03	Over-current during running	Load occurs mutation	Decrease fluctuation of load
Er. 04	Over-voltage in acceleration	1. Input -voltage is too high 2. Power switch is turned on and off frequently.	1. Check the voltage of power 2. Control the on-off of inverter by the control terminal
Er. 05	Over-voltage in deceleration	1. Deceleration time is too short 2. Input-voltage is abnormal	1. Extend the deceleration time. 2. Check the voltage of power supply. 3. Installation or reselect the braking resistor
Er. 06	Over-voltage during running	1. Power voltage is abnormal 2. There are energy feedback load	1. Check the voltage of power supply 2. Installation or reselect the braking resistor.
Er. 07	Over-voltage at stop	Power voltage is abnormal	Check the voltage of power
Er. 08	Under-voltage during running	1. Power voltage is abnormal There is great fluctuation of load in electric network.	1. Check the voltage of power 2. Provide the supply power separately
Er. 09	Inverter overload	1. Load is too heavy 2. Acc time is too short 3. Torque boost is too high or V/F curve is not suitable 4. Electric network is too low	1. Reduce the load or replace with higher capacity inverter. 2. Prolong Acc time. 3. Decrease the torque boost voltage or adjusting V/F curve. 4. Check mains voltage.
Code	Probable Cause	Fault description	Solution

Er. 10	Motor overload	1. Load is too heavy 2. Acc time is too short 3. The setting of protection factor is too little 4. Torque boost is too high or V/F curve is not suitable	1. Reduce the load 2. Prolong Acc time 3. Increase the over-load protection factor of motor (C-2) 4. Decrease torque boost voltage and adjust V/F curve.
Er. 11	Inverter overheat	1. Air duct is blocked 2. Too high environment temperature 3. Fan is damaged	1. Clear air duct or improve the air condition. 2. Improve ventilation condition or decrease carrier frequency. 3. Replace fan
Er. 12	Output ground	1. The output terminal of inverter grounds 2. The wire is too long between inverter and motor and the carrier frequency is too high.	1. Check the connecting wire 2. Shorten the connection wire or reduce the carrier frequency.
Er. 13	Interference	Misoperation because of ambient electromagnetic interference	Add the absorption capacitor to the interference source around inverter.
Er. 14	Output lack phase	Badness or disconnection of wire between Inverter and motor.	Check the connection wire
Er. 15	IPM fault	1. Output being short circuit or grounding 2. Load is too heavy	1. Check the wire 2. Look for the service to the manufacture.
Er. 16	Peripheral equipment fault	There are signal input on the peripheral equipment fault input terminal of Inverter	Check the signal source and the pertinent equipments.
Er. 17	Current detecting fault	1. The current detecting equipment or circuit is damaged 2. Auxiliary power source has problem	Look for the services to manufacture
Er. 18	RS485 communication fault	The sending and receiving of data occurs error in series communication	1. Detect the wire 2. Look for the help to the manufacture
Er. 19	PID feedback fault	1. PID feedback signal wire is disconnection; 2. The transistor which is used to detect the feedback signal, occurs the fault 3. The feedback signal is inconsistent with the setting signal	1. Check the feedback channel 2. Check whether there is fault on transistor. 3. Checkup the feedback signal whether consistent with the setting
Er. 20	The accessories connecting with the water supply system occurs the fault	1. No special accessories but select multi-pump constant-pressure water supply PID mode. 2. The connection with the accessory occurs the error	1. Improve the ordinary PID or single-pump constant-pressure water-supply mode. 2. Purchase the accessory 3. Check whether the connection between main control panel and accessories is solid

#### 4.6 Fault record inquiry

This series of inverter record the last six fault codes and the output parameters of last fault. This information is aid in looking up the fault causes. Fault information and State monitor parameters are stored uniformly, so please refer to the operation way to look up the information.

Monitor item	Contents
d-20	First fault record

d-21	Second fault record
d-22	Third fault record
d-23	Fourth fault record
d-24	Fifth fault record
d-25	Sixth fault record
d-26	Output freq of last fault
d-27	Setting freq of last fault
d-28	Output current of last fault
d-29	Output voltage of last fault
d-30	DC voltage of last fault
d-31	Temperature of module of last fault
d-32	Input terminal state of last fault
d-33	Accumulated running time of last fault

#### 4. Function parameter list

Description of symbols in the list:

"x" means that the parameter can not be changed during running.

" \* " means that the parameter has relation to the model of inverter.

"---" means that the parameter is the reserved one and displays " ---".

##### 4.1 Basic running parameters (A parameter)

Code	Name	Description	Min. unit	Factory setting	C ha ng e	Code addr.
A-0	Running parameter Selection	0: Basic running parameter 1: Intermediate running parameter 2: Advanced running parameter	1	1	x	00H
A-1	Frequency input channel selection	0: Panel potentiometer 1: Panel digital setup 2: External voltage signal 1 3: External voltage signal 2 4: External current signal 5: UP/ DW Acc and Dec control 6: External plus signal 7: RS485 terminal 8: Combination given 9: External terminal selection	1	0		01H
A-2	Frequency digital setup	0.0 ~ Upper limit frequency	0.01	0.0		02H
A-3	Running instruction channel selection	0: Keyboard control 1: External terminal (Key STOP is invalid) 2: External terminal (Key STOP is valid) 3: RS485 terminal (Key STOP is invalid) 4: RS485 terminal (Key STOP is valid)	1	0		03H
A-4	Running direction control	0: Same with the setting direction 1: Reverse with the setting direction 2: REV is prevented	1	0		04H
A-5	Rated voltage of load motor	100 ~ 250V 200 ~ 500V	1	220 380	x	05H
A-6	Rated frequency of load motor	5.00 ~ 500.0Hz	0.01	50.00	x	06H
A-7	Acc time 1	0.1 ~ 6000 Se	0.1	*		07H
A-8	Dec time 1	0.1 ~ 6000 Sec.	0.1	*		08H
A-9	Acc & Dec mode	0: Line 1: S curve	1	0		09H
A-10	Analog output (AO) setup	0: Output frequency 2: Output voltage 4: PID setting 6. Panel potentiometer 8. External voltage signal 1 9. External voltage signal 2 10. External current signal	1	0		0AH
A-11	Frequency output (FM) setup	1: Output Current 3: Motor rotate speed 5: PID feedback 7. Panel digital setup 11. External plus signal	1	0		0BH
A-12	Analog output (AO) gain	0.50~2.00	0.01	1.00		0CH

Code	Name	Description	Min. unit	Factory setting	C ha ng e	Code addr.
A-13	Frequency output (FM) gain	0.10~5.00	0.01	1.00		0DH
A-14	Analog output (AO) offset	0.AO offset 1. 0~10v 2.2~10v 3.0~20mA 4.4~20mA	1	3		0EH
A-15	OC1 Output setting	0: In the running 1: Frequency reaching. 2: Frequency level detection signal (FDT) 3: Over-load alarm 4: External fault halt 5: Output frequency reaching the upper-limit 6: Output frequency reaching the lower-limit 7: Inverter is in undervoltage halt 8: Inverter is running at zero speed 9: In the running process of PLC 10: A running cycle of PLC ends 11: A running stage of PLC ends 12: PLC running is finished. 13: Internal timer reaches the setting time. 14: Internal counter reaches the final value 15: Internal counter reaches the setting value 16: The upper-limit of pressure alarm 17: The lower-limit of pressure alarm.	1	0		0FH
A-16	OC2 Output setting		1	1		10H
A-17	REV/JOG key function selection	0: REV control; 1: Jog Control	1	0		11H

#### 4.2 Intermediate running parameters (b parameter)

Code	Name	Description	Min. unit	Factory setting	C ha ng e	Code addr.
b-0	V/F curve type selection	0: Constant torque curve 1: Dec torque curve 1 2: Dec torque curve 2	1	0	×	12H
